

Dashboard Templates, Charts, Graphs & Reports for Jira

Overview

Turn Jira dashboards into clear reporting insights

Jira manages work, but reporting can feel scattered and manual. This app simplifies it by bringing templates, charts, and advanced analytics together making dashboards easier to build, read, and use.

What the app includes

Gadget	What it does
Custom	Visual reports with 10 chart types
Issue List	Detailed issue tables on dashboards.
Dynamic Filter Controller	Shared dashboard filtering across all gadgets.
Time in Status	Workflow time analytics per stage.
Pivot Table	Cross-tabulation and aggregation.
Cumulative Flow Diagram	Flow and WIP tracking over time.
WIP Aging Charts	In-progress item aging analysis.

Together, these seven gadgets help teams understand their Jira data, explore issue details, track process health, and interact with the full dashboard from one place.

What Customers Can Do With The App

Built for everyday Jira reporting needs

This app helps create dashboards for common team and business use cases:

- Sprint health dashboards.
- Bug and defect tracking dashboards.
- Team workload reports.
- Release progress dashboards.
- Leadership and stakeholder reporting.
- Process bottleneck analysis (Time in Status).
- Multi-dimensional aggregation (Pivot Table).
- Flow and WIP monitoring (CFD + WIP Aging).

Core Value

- Better visibility into Jira data.
- Faster dashboard reporting.
- Less manual effort.
- More interactive dashboards.
- Easier reporting for teams and stakeholders.

Seven Gadgets, One Connected Dashboard

• Custom Charts

Turns Jira issue data into visual reports that are easy to understand. Supports 10 chart types including Pie, Bar, Grouped Bar, Stacked Bar, Line, 2D Line, Table, 2D Table, Funnel, and Tile.

• Issue List

Shows the actual Jira issues in a configurable table format with Smart Labels, Quick Filters, and export support.

- **Dynamic Filter Controller**

Connects all charts and issue tables with one shared filtering experience — one filter bar updates every gadget simultaneously.

- **Time in Status**

Analyzes how long issues spend in each workflow status using the full issue changelog. Answers "where does work get stuck?" with 7 report types and custom status groupings for Cycle Time and Lead Time.

- **Pivot Table**

Summarizes Jira issues in a cross-tabulation matrix. Group issues by up to 3 row fields and 3 column fields, aggregate by count/sum/average/min/max, and visualize as a table, heatmap, or chart.

- **Cumulative Flow Diagram**

Shows how work accumulates across workflow stages over time. Tracks sprint health, identifies bottlenecks visually, and supports 6 band modes including board columns and custom fields.

- **WIP Aging Charts**

Plots in-progress items as a scatter chart where each dot's position shows how long that item has been active. Instantly reveals stalled work and SLA risks with configurable average, threshold, and percentile reference lines.

Basic Setup: How This App Works

Getting started is simple. Add one of the app's gadgets to a Jira dashboard, choose the Jira data you want to report on, and configure how that information should appear.

Add a Gadget to Your Jira Dashboard.

To add a gadget:

- Open an existing Jira dashboard or create a new one.
- Click **Add gadget**.
- Search for the gadget you want to use (Custom Charts, Issue List, Dynamic Filter Controller, Time in Status, Pivot Table, Cumulative Flow Diagram, WIP Aging Charts).
- Add the gadget to the dashboard.
- Select the data source and adjust the settings.
- Click **Save gadget**.

Before saving, the gadget opens in edit mode so you can review the setup, preview the result, and make changes as needed.

Custom Charts

Visual reporting directly inside Jira dashboards

Custom Charts helps teams turn Jira issue data into visual reports that are easier to read than a long list of issues.

Common Chart Types

- Pie charts for distribution.
- Bar charts for comparison.
- Line charts for trends.
- Tables for exact values.
- Funnel charts for stage flow.
- Tile charts for key numbers.
- Grouped Bar for multi-series comparison.
- Stacked Bar for composition breakdown.
- 2D Line for parallel trend comparison.
- 2D Table for cross-tab matrices.

Main Chart Features

- Chart By - choose how issues are grouped.
- Calculations - Count, Sum, Average + Goal/Trend/Average/Cumulative lines.
- Display settings for readability and presentation.
- 2D Chart Support for deeper cross-dimensional analysis.
- Templates for fast setup.
- Export to PNG, PDF, and CSV.

Issue List

See The Real Issues Behind The Report

Issue List helps teams display Jira issues in a dashboard table that is clear, practical, and easy to work with.

Main Issue List Features

- Configurable Columns - any Jira field.
- Column Reordering - drag and drop.
- Quick Filters - one-click filter buttons.
- Smart Labels - visual badges based on JQL or filter conditions.
- Sorting - by any column.
- Pagination & display customization.
- Templates - pre-built table layouts.
- Export options - CSV, PNG, PDF.

Dynamic Filter Controller

Connect The Whole Dashboard With Shared Filters

Dynamic Filter Controller connects all gadgets. Instead of changing each gadget one by one, teams add one shared filter bar at the top of the dashboard.

Supported Filter Types

Jira fields

Text search

Custom JQL

Saved filters

Preset Tabs

Named filter views (e.g., All Work, My Issues, This Sprint, Bugs Only) let users switch between preset dashboard states with a single click.

Time in Status

Measure How Long Work Sits in Each Stage

Time in Status reads the full issue changelog to calculate exactly how long each issue has spent in every workflow status - not just the current state, but the complete history of transitions.

Report Types

Report	What It Shows
Time in Status	Per-issue time in each status
Average Time	Mean time per status across all issues
Time in Status per Date	Temporal trend of time in status
Status Count	Volume of issues that passed through each status
Transition Count	How many times each status was visited (rework detection)
Time in Assignee	Time spent with each assigned person
Status Entrance Date	When each issue first entered each status

Key Features

- **Status Groups** - combine statuses into named bands (built-in Cycle Time and Lead Time groups).
- **Work Schedule** - configure per-day working hours so calculations exclude non-working time.
- **10 time format options** - Business Days/Hours/Minutes, Decimal Days/Weeks, HoursMinutes, and more.
- **Date range filter** - scope analysis to rolling periods or custom date windows.
- **Export** - CSV and PNG

Pivot Table

Summarize Any Jira Data as a Cross-Tabulation

- The Pivot Table gadget transforms Jira issue data into a cross-tabulation matrix. Place any combination of Jira fields on rows and columns, choose how to aggregate the values, and display the result as a table, heatmap, or chart.

Aggregation Methods

- Count · Sum · Average · Minimum · Maximum · Count % · Sum %

Display Types (9)

- Table · Table Heatmap · Table Row Heatmap · Table Column Heatmap · Column Chart · Bar Chart · Line Chart · Stacked Area Chart · Pie Chart

Key Features

- Up to 3 row fields and 3 column fields for multi-level grouping.
- Make values clickable — click any cell to open the matching Jira issue list.
- Heatmap coloring — Red, Blue, Green, or Grey base color.

- Totals row/column, percentage column, average column.
- Date field formatting — week, month, quarter, year display formats.
- Export — CSV and PNG

Cumulative Flow Diagram

Track Work Flow Across Your Pipeline Over Time

The CFD shows how issues accumulate across workflow stages over time as a stacked area chart. Each band represents a stage; the width of a band on any given day shows how many issues were in that stage.

Band Modes

Status Categories · Individual Statuses · Board Columns · Board Column Categories · Work Item Types · Custom Field Values

Key Features

- Board integration — use column definitions from a Jira Software board.
- Include sub-tasks toggle.
- Latest sprint auto — always shows the current sprint without reconfiguring.
- Exclude/reorder/recolor bands individually.

WIP Aging Charts

Identify Stalled Work Before It Becomes a Problem

WIP Aging Charts plots each in-progress issue as a dot on a scatter chart. The dot's horizontal position shows how long the issue has been in its current state. Reference lines mark your average age, SLA threshold, and statistical percentile so outliers are immediately visible.

Age Calculation Methods

- Time since last entry in current status
- Sum of all time in current status (counts re-entry)
- Sum of all time in the category of current status
- Time since first entry in current status category
- Time since work item creation

Reference Lines

- **Average line** - mean age of all current WIP.
- **Threshold line** - your SLA boundary (configurable value).
- **Percentile line** -e.g., 85th percentile for Kanban SLE tracking.

Example Use Cases

Sprint Dashboard

Use Custom Charts to show sprint progress, Issue List to review active work, Dynamic Filter Controller for filter switching, and WIP Aging to spot stalled items before the sprint ends.

Bug Tracking Dashboard

Use Custom Charts to monitor bug trends, Issue List to review open bugs by priority, and Time in Status to identify which stages bugs are sitting in longest.

Team Workload Dashboard

Use Custom Charts to compare work across assignees, Pivot Table for a multi-dimensional breakdown (assignee x status x priority), and Issue List to inspect individual tasks.

Release Dashboard

Use the dashboard to track release progress, review blockers, and monitor issue details connected to the release.

Release Readiness Dashboard

Use CFD to track flow across the release pipeline, WIP Aging to flag at-risk items, and Custom Charts to show completion percentage.

Process Analytics Dashboard

Use Time in Status for Cycle Time and Lead Time measurement, CFD for flow health, and WIP Aging for SLA monitoring - a complete Agile/Kanban analytics suite.

Why Customers Use This App

- Clearer visibility into Jira data.
- Less manual reporting work.
- Better combination of summary and detail.
- More interactive dashboards.
- Deeper process analytics without leaving Jira.
- Easier reporting for meetings and reviews.
- Faster movement from reporting to action.
