

Time Tracking, Resource Planning & Project Management

1. Overview

As teams scale on Jira, critical visibility gaps appear - managers can't see who's overloaded, backlogs are prioritized by gut feel, time data is scattered, and portfolio health requires manual reporting across multiple boards.

This app solves those problems by giving teams and managers a complete operations toolkit built natively inside Jira:

- Track and report on time using timesheets, calendars, charts, and custom reports.
- Analyze team workload, capacity, delivery risk, and status bottlenecks in real time.
- Score and rank the backlog using configurable, weighted scoring models.
- Monitor all projects and initiatives from a single portfolio view with six visualization modes.
- Control access with a clean role model tied directly to Jira's user management.

Designed for:

Engineering teams, project managers, and delivery leads who need operational visibility inside Jira - without external tools, manual spreadsheets, or duplicate data entry.

Pre-Demo Briefing

Demo of the Time Tracking, Resource Planning & Project Management on clovity-demos.atlassian.net. Follow sections in order or jump to the module the client cares about most.

Demo Environment

Site: clovity-demos.atlassian.net.

Login: Use the Any user account.

Workload Schemes

Default: 8h/day - Ash, Shawn, Victor.

Part Time: 4h/day - Christopher, Ashton Maka.

Demo Team Members

Ash Parker · Shawn Page

Victor Parker (Full Time 8hrs)

Christopher (Part Time) · Ashton

Maka (Part Time 4 hrs).

All Assigned: USA Holiday Calendar.

Pre-Configured Leaves

Ash Parker: Vacation Jun 3-4.

Shawn Page: Sick Jun 1.

Victor Parker: Vacation Jun 9-11.

Opening Hook:

"What you're about to see is a single Jira app - that gives your teams full visibility into Capacity Planning, Time - Tracking, portfolio health, and priorities backlogs, all from inside Jira."

1. Capacity Planner

Show clients how to know - before the sprint starts - whether their team has the bandwidth to deliver. Stop planning in the dark.

The problem you're solving:

"Every manager we talk to says the same thing - we plan the sprint, people say they're available, and then halfway through we find out two people are on vacation and one is only part-time this week. Capacity Planner gives you that picture upfront, before you commit."

1. Settings Tour - Show How It's Configured

Start by showing the client that all the heavy lifting is configured once and reused everywhere. This builds confidence that the data is trustworthy.

- **Navigate to Settings** - Click Capacity Planner in the top navigation, then click Settings in the left sidebar.

Capacity Planner > Settings

- **Show Workload Schemes** - Point out the two schemes:

Default - 8h/day assigned to Ash, Shawn, Victor.

Part Time - 4h/day assigned to Christopher & Ashton Maka.

"This means our capacity math already accounts for the fact that two team members are only half-day contributors. No guessing."

- **Show Holiday Calendar** - Click on **Holiday Calendars**. Show the USA Holiday Calendar assigned to all team members.

"Public holidays are automatically excluded from the capacity calculation. Memorial Day, Independence Day - all handled."

- **Show Team Setup** - Click **Teams**. Open Demo Team and show the 5 members listed with their respective workload scheme assignments.

Value Point

Configuration is done once by the admin. Every manager who uses the planner after that automatically gets accurate, policy-compliant capacity numbers - no manual inputs, no spreadsheet gymnastics.

2. Vacation & Leave Management

Show how individual leaves feed directly into the capacity calculation, so the planner always reflects real availability - not theoretical availability.

- Open Vacation Planning

Capacity Planner > Vacation Planning

- Point out the pre-loaded leaves:

Team Member	Type	Dates	Hours Lost
Ash Parker	Vacation	Jun 3 - 4, 2026	16h (2 full days)
Shawn Page	Sick	Jun 1, 2026	8h
Victor Parker	Vacation	Jun 9 - 11, 2026	24h (3 full days)

"Notice these leaves automatically reduce available hours in the planner. Ash is down 16 hours in the first week of June alone."

Talk Track

"In most teams, this information lives in someone's Slack DMs or a shared calendar that nobody checks before the sprint. Here it feeds directly into the capacity calculation - so when a manager says 'we have capacity for 80 hours this sprint,' that number is real."

3. Planning Calendar - June 2026

This is the centerpiece of the Capacity Planner. Walk the client through the capacity view.

- **Open Planning Calendar**

Capacity Planner > Planning Calendar

- **Select Demo Team + June 2026** - Use the Team dropdown to select Demo Team. Use the month picker to navigate to **June 2026**.

- **Explain what the client sees:**

Each team member appears as a row with their daily/weekly capacity in hours. Vacation and sick days show as blocked-out cells.

Public holidays from the USA calendar appear automatically.

Part-time members (Christopher, Ashton Maka) show 4h max per working day vs. 8h for full-time.

Total team capacity for June is visually summarized.

- **Assign work to team members** - Click on an open cell for a team member and show how you can assign a Jira issue or block hours for a specific project directly from the calendar view.

"A manager can drag-assign tasks here and immediately see how much buffer remains before the team is overloaded."

Talk Track - Point at the Capacity Numbers

"Without this, a manager looks at the backlog, looks at the team roster, and estimates in their head. With this, they see at a glance: Demo Team has 312 available hours in June - not the theoretical 400, because we've already subtracted Ash's vacation, Shawn's sick day, Victor's leave, part-time schedules, and the Memorial Day holiday. That's the real number."

4. Reports - Planned & Planned vs. Actual

- **Navigate to Reports**

Capacity Planner > Reports

- **Open Planned Report** - Select projects **1, 2, and 4**. Select team **Demo Team**. Set date range to cover June 2026.
- **Cycle through Group By options** - Demonstrate all four groupings:

Group by Project

Group by Assignee

Group by Issue Type

Group by Issue

"Same data, four different answers. A project manager wants to see by project. A team lead wants to see by assignee. Both get their view instantly."
- **Switch to Planned vs. Actual** - Select the Planned vs. Actual tab. Show the delta column highlighting where work ran over or under estimate.
This is a critical accountability view - great for retrospectives and billing conversations.
- **Export to PDF/CSV** - Click the Export button and show the download option. Mention this is ready to drop into a status update or client report.

Value Point

Planned vs. Actual is the bridge between planning and accountability. It answers "did we deliver what we said we would?" - and it does it in one click, not a half-day data pull from Jira and Excel.

5. Analytics - Four Tabs of Insight

- **Navigate to Analytics**

Capacity Planner

 >

Analytics
- **Walk through all four analytics tabs** - Click each tab & narrate what the chart answers:

Tab	What It Shows	Who Cares
Capacity Overview	Available vs. allocated hours by member	Team Lead, PMO
Utilization	% utilization per person / per project	Resource Manager
Trend Analysis	Capacity trends over time (weeks/months)	Director, VP Eng

Project Distribution	How hours are split across projects	Portfolio Manager
----------------------	-------------------------------------	-------------------

Closing Talk Track for Capacity Module

"Everything you just saw - the workload schemes, the holiday calendar, the leave management, the planning calendar, and the reports - is configured once and runs automatically. A manager opens this every Monday morning instead of opening a spreadsheet. That's the difference."

2. Time Tracking

From logging a single hour to a full approval workflow - show clients that time tracking doesn't have to be painful.

The problem you're solving:

"Time tracking tools are either too clunky to use daily or too simple to give meaningful reports. Developers skip it. Managers chase people. Reports are always incomplete. What you're about to see fixes all three - logging is fast, approvals are structured, and reports are accurate."

1. My Calendar - The Daily View

- **Navigate to My Calendar**

Time Tracking > My Calendar

- **Show Week View** - The default is the current week. Point out the time blocks already logged across the week. Show how the calendar grid mirrors a standard work calendar. "This is the developer's daily interface. They see exactly what they've logged this week - same mental model as Google Calendar."

- **Switch to Month View** - Click the **Month** toggle. Show the monthly summary with total hours logged per day.
"A manager or team lead can see at a glance whether the team is logging consistently - or whether data is missing."

2. Assigned Work Items - Log Work with One Click

This is the feature that reduces friction to near-zero. Team members log time against the issues assigned to them without ever leaving the calendar.

- **Open Assigned Work Items panel** - On the right side of My Calendar, find the Assigned Work Items section. It shows all Jira issues currently assigned to the logged-in user.
- **Drag an issue onto a calendar day** - Grab any issue card from the panel and drag it onto a date on the calendar. The Log Work form opens pre-populated with the issue.
- **Fill in the Log Work form:**
Time Spent - enter 2h
Date - auto-filled from drop target
Description - optional free text
If worklog fields are configured: select account, fill required fields
"No Jira navigation, no searching for the issue key, no copy-paste. The user stays in their flow."
- **Click Save** - The log appears on the calendar immediately. Show the time block added to the day.
- **Edit/Delete a log** - Click the time block on the calendar to show the edit options. Demonstrate updating the time spent and saving.

Talk Track

"The #1 reason time tracking fails is friction. If it takes 5 clicks to log 30 minutes, people don't do it. Drag, drop, two fields, done. That's it. And because the issues come from Jira automatically, there's no chance they're logging to the wrong project code."

3. My Timesheet - Configure & Submit

- **Navigate to My Timesheet**

Time Tracking > My Timesheet

- **Show the period configuration** - The period is set to **Monthly**. The current period is visible with total hours logged. Point out the progress bar showing hours vs. target (the demo account is ~168h behind - this is intentional to show a realistic scenario).
"Timesheets have a configurable period - weekly or monthly - matching whatever billing or payroll cycle the organization uses."
- **Show the timesheet grid** - Each row is a Jira issue. Each column is a day in the period. Hours are editable inline.
"A team member can review and add/adjust logs directly here - it's like a spreadsheet that writes back to Jira worklogs in real time."
- **Submit Timesheet** - Click the **Submit for Approval** button. Select the approver (show Akash Gupta as the approver in the dropdown). Confirm submission.
"One click sends the timesheet to the approver. The approver gets a App notification. No emails, no spreadsheet attachments."

Value Point

Timesheet submission creates an auditable trail. Every submission is timestamped, linked to real Jira worklogs, and carries the approver's sign-off. This is the compliance story - especially powerful for consulting firms, agencies, and government contractors.

4. Approvals

- **Navigate to Approvals**

Time Tracking > Approvals

- **Show the pending approval** - The demo has **Ash Parker's** April 1-30 timesheet submitted to **Akash Gupta** awaiting approval. Click on it to open.

- **Walk through the approval detail view:**
Submitter name, period, total hours.
Issue-by-issue breakdown with hours per day.
Any notes the submitter left.
Approve / Request Changes / Reject buttons.
- **Show the Approve action** - Don't actually approve (to keep the demo data clean).
Hover over Approve and show the confirmation modal.
"The manager reviews, approves, and it's locked. If they have questions, they click 'Request Changes' - the submitter gets notified and can edit."

Talk Track - Approvals

"Every org I talk to has a different approval workflow living somewhere between email and a shared drive. This puts it in Jira, tied to the actual time data, with a full audit history. When payroll asks 'was this approved?' - the answer is one click away."

5. Reports - Multi-User Time Reporting

- **Navigate to Reports**
Time Tracking > Reports
- **Configure the report** - Select all 5 Demo Team members. Set date range to last 30 days.
Group by Assignee first, then switch to Project.
- **Show the total hours table** - Point out the column totals: total hours logged per person vs. target hours for the period.
"This is the report a manager sends to finance at end of month. It's accurate because it comes directly from Jira worklogs - not a manually compiled spreadsheet."
- **Export the report** - Demonstrate PDF and/or CSV export. Show the clean formatted output.

3. Portfolio Management

Give leadership the cross-project view they've been asking for - without a separate tool, a weekly status meeting, or a 50-tab Confluence page.

The problem you're solving:

"Leadership wants to know: are our projects on track? Which ones are at risk? Where are the blockers? Jira gives them a per-project answer. This gives them a portfolio-level answer - across all projects, in one view, right now."

1. Build the Portfolio View - Filter Setup

- **Navigate to Portfolio Management**

Portfolio Management > Portfolio Table

- **Set filters:**

Projects: Select Projects 1, 2, 3, and 4.

Date Range: Last Quarter.

Click **Apply**.

: "We're looking at 4 projects simultaneously, filtered to last quarter. Every leader in this room has been asked for this view - and most of them build it manually every week."

2. Table View - Issues Across All Projects

- **Walk through the table columns** - Default columns include: Issue Key, Summary, Assignee, Status, Priority, Story Points.
"Every row is a Jira issue. Every column is live - this isn't a snapshot, it's real-time data from Jira."

- **Add custom columns** - Click **Add Column**. Add:

Progress

Formula Column

Time in Status

"Progress shows sub-task completion. The formula column lets you create custom KPIs - like burn rate or estimated completion date. Time in Status shows bottlenecks: issues stuck in 'In Review' for 10 days."

- **Group by hierarchy** - Click the **Group By** dropdown and select Epic or Parent. Show the collapsible hierarchy tree - Epics at top, Stories beneath, Sub-tasks below that.
- **Show inline editing** - Click on an assignee cell and show the dropdown to reassign. Click a status cell and show the transition picker.
"Leaders can make changes directly from the portfolio view - no need to open each individual issue."

Talk Track - Table View

"This is what a weekly status meeting is supposed to produce - one view of all projects, all issues, all statuses. Except here it takes 10 seconds to filter, not 30 minutes to compile. And it's always current."

3. Gantt View - Timeline & Dependencies

- **Switch to Gantt View** - Click the **Gantt** icon/tab at the top of the portfolio view. The same filtered data renders as a timeline.
- **Walk through the Gantt features:**
Each bar = one Epic or Story with start/due dates from Jira.
Color-coded by project for easy visual separation.
Zoom levels: Day / Week / Month / Quarter.
Milestones and due dates appear as markers on the timeline.
- **Show dependency tracking** - Click on a task bar and show the "Add Dependency" option. Draw a dependency arrow between two issues. Show how a blocked dependency is visually highlighted.
"Dependencies are often the invisible risk in project planning. If Task B can't start until Task A is done, and Task A is two weeks late, you want to know before it cascades - not after."
- **Drag to reschedule** - Drag a task bar to a new date range and show the date fields updating in real time. Point out how dependent tasks automatically flag as impacted.

Value Point

Gantt views in Jira Premium cost extra and are project-scoped. This gives you a cross-project Gantt for all 4 projects in a single pane - with live Jira data, no manual entry, and dependency tracking built in.

4. Saved Views - Build Once, Reuse Always

- **Save the current view** - Click **Save View** and give it a name like "Q2 Portfolio - All Projects".
- **Show multiple saved views** - Open the saved views list and show 2-3 pre-configured views with different filters and column configurations.
"Different stakeholders need different views. The PMO wants the full portfolio. The CTO wants only at-risk items. The team lead wants their own project. Each person sets up their view once and comes back to it every day."

Closing Talk Track for Portfolio Module

"Portfolio Management closes the gap between Jira's project-level focus and the executive need for a portfolio-level picture. No Confluence page to maintain, no spreadsheet to update. One source of truth, always current, across every project."

4. Backlog Prioritization

Turn a hundred-item backlog from a gut-feel debate into a data-driven, defensible priority list in under 5 minutes.

The problem you're solving:

"Most teams prioritize by whoever shouts loudest in the backlog refinement meeting. This module gives every item a score based on a repeatable formula - and then shows you the priority matrix so the conversation shifts from opinion to data."

1. Set Up the Scoring Context

- **Navigate to Backlog Prioritization**

Backlog Prioritization > Backlog Table

- **Configure the filter:**

Projects: Project 4 — CRM.

Date Range: Last Quarter.

Click **Apply**.

- **Select the ICE Scoring Template** - In the Scoring Template dropdown, select **ICE** (Impact, Confidence, Ease).
"ICE is one of the most widely used prioritization frameworks. Impact: how much does this move the needle? Confidence: how sure are we? Ease: how hard is it to build. Multiply them and you get a score."

ICE score = Impact × Confidence × Ease. A feature that's high impact, high confidence, and easy to build floats to the top automatically.

2. Inline Scoring - Score the Backlog in Real Time

- **Walk through the scoring columns** - The table shows Issue, Summary, Status, plus three scoring columns: **Impact, Confidence, Ease**, and calculated **ICE Score**.
- **Score an item inline** - Click the Impact cell for the top unscored item. Enter a value (e.g., 8). Tab to Confidence (7). Tab to Ease (5). Watch the ICE Score auto-calculate to **280**.
"The team can score items together in a refinement meeting - one screen, everyone watching, decisions made in the room."
- **Show the sort by ICE Score** - Click the ICE Score column header to sort descending. The backlog re-orders instantly with the highest-priority items at the top.
"The backlog re-orders itself. No arguing about priority. The formula decides. Teams can still override, but now they need a reason to override the data."
- **Show partially scored backlog** - Point out items without scores yet. These can be scored async - team members score their own items, PMs review, and the list self-organizes.

Talk Track - Scoring

"The goal isn't a perfect score - it's a shared definition of priority. Before this, everyone had a different definition of 'high priority.' Now 'high priority' means ICE score above 200. That's a decision, not a debate."

3. Priority Matrix - The Executive View

- **Switch to Priority Matrix view** - Click the **Matrix** tab or icon. The view shifts to a 2x2 quadrant chart.
- **Explain the quadrants:**

Quadrant	Label	Action
High Impact / High Ease	Quick Wins	Do these first - maximum ROI
High Impact / Low Ease	Major Projects	Plan carefully - high value, high effort
Low Impact / High Ease	Fill-ins	When there's spare capacity
Low Impact / Low Ease	Time Wasters	Deprioritize or remove

- **Hover on a data point** - Hover over any bubble on the matrix to show the issue tooltip
Issue Key, Summary, Score, Assignee.
- **filtering from the matrix** - Click on a quadrant or filter by assignee to highlight a subset of items. Show how the table below (or beside) the matrix updates in sync.

Talk Track - Priority Matrix

"This is the slide that used to take 2 hours to build for a quarterly planning meeting. Now it's live, it's based on the team's actual scoring in Jira, and it updates every time someone changes a score. When leadership asks 'what are we building next quarter?' - you show them this."

Value Point

Backlog Prioritization is the missing link between strategic goals and sprint planning. It creates a shared, data-backed priority framework that teams and leadership can both trust - reducing planning overhead and building-the-wrong-thing risk.
